

S2S-03: IAM, SSO, and User Migration

Series: S2S | **Notebook:** 3 of 12 | **Created:** March 2026 | **Last Updated:** 03/23/2026

Overview

Identity and access management is often the most politically complex part of a SaaS-to-SaaS migration. Groups, policies, and SSO configurations must be rebuilt in the target tenant — and a consolidation is the perfect opportunity to rationalize overgrown IAM structures.

Table of Contents

1. [IAM Migration Strategy](#)
 2. [SSO and SAML Reconfiguration](#)
 3. [Group and Policy Migration](#)
 4. [User Migration](#)
 5. [Service Account Migration](#)
 6. [Cloud Provider Identity Mapping](#)
-

Prerequisites

Requirement	Details
Source Tenant	Admin access, IAM admin role
Target Tenant	Admin access, IAM admin role
OAuth Client	account-idm-read , account-idm-write , iam-policies-management scopes
IdP Access	Admin access to corporate identity provider (Okta, Azure AD, etc.)

1. IAM Migration Strategy

Decision: Lift-and-Shift vs Redesign

Approach	When to Use	Pros	Cons
Lift-and-Shift	Simple relocation, no org changes	Fast, minimal disruption	Carries forward any existing IAM debt
Redesign	Consolidation, M&A, compliance changes	Clean architecture, right-sized access	More planning, requires stakeholder alignment
Hybrid	Migrate critical access first, redesign later	Quick initial migration	Requires follow-up project

Recommendation: Tenant consolidation is the best opportunity to redesign IAM. You are already asking users to change — use that window to fix group sprawl and overprivileged policies.

IAM Inventory from Source Tenant

Export the current IAM structure:

```
# Export IAM groups
terraform import dynatrace_iam_group.group1 "<group-uuid>"

# Export IAM policies
terraform import dynatrace_iam_policy.policy1 "<policy-uuid>"

# Export policy bindings
terraform import dynatrace_iam_policy_bindings_v2.binding1 "<binding-uuid>"
```

2. SSO and SAML Reconfiguration

SAML Configuration Checklist

Step	Action	Notes
1	Create new SAML application in IdP for target tenant	New Entity ID, new ACS URL
2	Configure SAML assertion attributes	Must match target tenant expectations
3	Enable JIT provisioning (if used)	Users auto-created on first login
4	Configure SCIM endpoint (if used)	New SCIM URL and token for target
5	Test with a pilot user	Verify login, group assignment, permissions
6	Update IdP group assignments	Map IdP groups to new Dynatrace groups

IdP-Specific Guidance

IdP	Key Steps	Gotcha
Okta	Create new SAML app, configure SCIM provisioning	SCIM token is per-application
Azure AD (Entra ID)	New Enterprise App, configure provisioning	Group claim limited to 150 groups per assertion
OneLogin	New SAML connector, configure SCIM	Verify attribute mapping format
PingFederate	New SP connection, provisioning adapter	Certificate format (PEM required)
Google Workspace	New custom SAML app	Limited SCIM support, may need adapter

Cross-Domain SSO for Cloud Transformations

When migrating between cloud providers, identity federation changes:

Transformation	Source IdP	Target IdP	Action
AWS → Azure	AWS IAM / Okta	Azure AD (Entra ID)	Federate Azure AD with Dynatrace; migrate Okta groups if keeping Okta
Azure → AWS	Azure AD	AWS IAM / Okta	Create new SAML app in Okta or configure AWS SSO federation
Any → GCP	Varies	Google Workspace / Cloud Identity	Create custom SAML app in Google Workspace
Multi-Cloud	Varies	Keep existing IdP	Update SAML app ACS URL to point to target tenant

3. Group and Policy Migration

Terraform Export from Source

```
# Export current groups
resource "dynatrace_iam_group" "sre_team" {
  name      = "sre-team"
  description = "SRE team with full environment access"
}

# Export current policies
resource "dynatrace_iam_policy" "sre_settings" {
  name      = "SRE Team - Settings Access"
  environment = var.dynatrace_environment_id
  statement_query = <&lt;-EOT
    ALLOW settings:objects:read, settings:objects:write
    WHERE settings:schemaId startsWith "builtin:alerting";
    ALLOW settings:objects:read, settings:objects:write
    WHERE settings:schemaId startsWith "builtin:anomaly-detection";
  EOT
}
```

Apply to Target

```
# Point Terraform at target tenant
export TF_VAR_target_tenant_url="https://&target&.live.dynatrace.com"
export TF_VAR_target_api_token="dt0c01.xxxx"
export TF_VAR_target_client_id="dt0s02.xxxx"
export TF_VAR_target_client_secret="xxxx"
export TF_VAR_target_account_id="xxxx-xxxx-xxxx"

terraform plan
terraform apply
```

4. User Migration

Method	Steps	Best For
SCIM Auto-Provision	Configure SCIM on target tenant; users sync automatically	Organizations with SCIM already configured
JIT Provisioning	Enable JIT on target; users created on first SSO login	Organizations using SSO without SCIM
Manual Invitation	Invite users via Account Management UI or API	Small teams, external users
API Bulk Invite	POST /iam/v1/accounts/{id}/users for each user	Large teams without SCIM

5. Service Account Migration

Service accounts and OAuth clients **cannot be migrated** — secrets are not exportable. Create new ones in the target tenant:

Item	Action	Critical Steps
OAuth Clients	Create new in target	Copy scopes from source; update CI/CD secrets
API Tokens	Create new in target	Match scopes; update all consumers
Service Users	Create new in target	Reassign as workflow actors

Warning: API tokens and OAuth client secrets from the source tenant will stop working when agents cut over to the target. Ensure all consumers are updated before cutover.

6. Cloud Provider Identity Mapping

When migrating between cloud providers, map identity constructs:

Concept	AWS	Azure	GCP
Identity Provider	AWS IAM Identity Center / Okta	Azure AD (Entra ID)	Google Cloud Identity
Service Principal	IAM Role	Service Principal / Managed Identity	Service Account
Group	IAM Group / Okta Group	Azure AD Group	Google Group
MFA	AWS MFA / Okta MFA	Azure AD Conditional Access	Google 2-Step Verification
SCIM	Okta SCIM / AWS SSO SCIM	Azure AD Provisioning	Google SCIM (limited)

Next Steps

Continue to **S2S-04: OneAgent and ActiveGate Cutover** to plan the agent migration.
