

S2S-06: Cloud Integration Migration

Series: S2S | **Notebook:** 6 of 12 | **Created:** March 2026 | **Last Updated:** 03/23/2026

Overview

Cloud integrations (AWS, Azure, GCP) connect your Dynatrace tenant to cloud provider APIs for infrastructure metrics, log ingestion, and service discovery. These integrations must be reconfigured in the target tenant — credentials, IAM roles, and monitoring configurations are all tenant-specific.

Table of Contents

1. [Cloud Integration Inventory](#)
 2. [AWS Integration Migration](#)
 3. [Azure Integration Migration](#)
 4. [GCP Integration Migration](#)
 5. [Multi-Cloud Considerations](#)
 6. [Cloud Transformation Scenarios](#)
-

Prerequisites

Requirement	Details
Cloud Provider Access	Admin access to AWS/Azure/GCP accounts
Target Tenant	Provisioned with ActiveGate (for cloud integrations)
IAM Roles	Cloud provider IAM roles created for target tenant

1. Cloud Integration Inventory

Monaco download limitation: Cloud provider credentials (AWS, Azure, Kubernetes) **cannot be exported** via `monaco download`. Monaco can deploy credential configurations but not extract existing ones. You must recreate credentials manually in the target tenant. This is documented in the [Monaco API coverage](#).

Before migration, document all active cloud integrations in the source tenant:

Integration	Source Config	Credentials	Metrics Collected
AWS CloudWatch	Regions, services, namespaces	IAM Role ARN or Access Key	EC2, RDS, Lambda, ELB, etc.
Azure Monitor	Subscriptions, resource groups	Service Principal or Managed Identity	VMs, App Service, AKS, etc.
GCP Cloud Monitoring	Projects, services	Service Account Key or Workload Identity	GCE, GKE, Cloud SQL, etc.
AWS Log Forwarder	S3 buckets, Lambda functions	IAM Role	CloudWatch Logs, S3 access logs

2. AWS Integration Migration

Step-by-Step

Step	Action	Where
1	Create new IAM role in AWS with trust policy for target tenant	AWS IAM Console
2	Attach monitoring policies to the role	AWS IAM Console
3	Configure AWS integration in target Dynatrace tenant	Dynatrace UI → Settings → Cloud & Virtualization
4	Enter role ARN and external ID	Dynatrace UI
5	Select regions and services to monitor	Dynatrace UI
6	Verify metrics flowing	Dynatrace UI → Infrastructure

IAM Trust Policy for Target Tenant

```
{
  "Version": "2012-10-17",
  "Statement": [{
    "Effect": "Allow",
    "Principal": {
      "AWS": "arn:aws:iam::&ld;dynatrace-account-id&gt;;root"
    },
    "Action": "sts:AssumeRole",
    "Condition": {
      "StringEquals": {
        "sts:ExternalId": "&ld;target-tenant-external-id&gt;";
      }
    }
  }]
}
```

Note: The Dynatrace account ID and external ID are different for each tenant. Get these from the target tenant's AWS integration setup wizard.

AWS Log Forwarding

If using the Dynatrace AWS Log Forwarder Lambda:

1. Deploy a new Log Forwarder stack pointing to the target tenant
2. Update S3 event notifications to trigger the new Lambda
3. Verify logs appear in target tenant

3. Azure Integration Migration

Step-by-Step

Step	Action	Where
1	Create new App Registration in Azure AD	Azure Portal → App Registrations
2	Grant Monitoring Reader role on subscriptions	Azure Portal → Subscriptions → IAM
3	Configure Azure integration in target tenant	Dynatrace UI → Settings → Cloud & Virtualization
4	Enter Tenant ID, Client ID, Client Secret	Dynatrace UI
5	Select subscriptions and services	Dynatrace UI
6	Verify metrics flowing	Dynatrace UI → Infrastructure

Azure Log Ingestion

Method	Migration Action
Azure Event Hub	Create new Event Hub consumer group for target tenant; update Dynatrace ActiveGate config
Azure Functions	Deploy new function with target tenant endpoint
Diagnostic Settings	Update to forward to new Event Hub / ActiveGate

4. GCP Integration Migration

Step-by-Step

Step	Action	Where
1	Create new Service Account in GCP project	GCP Console → IAM → Service Accounts
2	Grant Monitoring Viewer and Compute Viewer roles	GCP Console → IAM
3	Generate JSON key for Service Account	GCP Console
4	Configure GCP integration in target tenant	Dynatrace UI → Settings → Cloud & Virtualization
5	Upload Service Account key	Dynatrace UI
6	Select projects and services	Dynatrace UI
7	Verify metrics flowing	Dynatrace UI → Infrastructure

5. Multi-Cloud Considerations

When migrating a tenant that monitors multiple cloud providers:

Consideration	Action
Naming consistency	Standardize tag naming across providers (app , env , team)
Unified dashboards	Recreate cross-cloud dashboards with new entity IDs
Network zones	Configure zones for each cloud's ActiveGate deployment
Cost allocation	Align Grail bucket and enrichment rules across providers
Credential rotation	Schedule rotation for all cloud provider credentials post-migration

6. Cloud Transformation Scenarios

When the migration includes a cloud provider change, additional integration work is required:

AWS → Azure

Component	AWS	Azure Equivalent	Action
Compute monitoring	EC2 metrics via CloudWatch	VM metrics via Azure Monitor	Configure Azure integration
Container platform	EKS	AKS	Deploy DynaKube to AKS, configure Workload Identity
Serverless	Lambda	Azure Functions	Install OneAgent extension or configure OpenTelemetry
Log forwarding	CloudWatch → Dynatrace Lambda	Event Hub → ActiveGate	Deploy new log pipeline
Load balancer	ALB/NLB metrics	Application Gateway / Load Balancer metrics	Update dashboards
Database	RDS metrics	Azure SQL / Cosmos DB metrics	Update SLOs

Azure → AWS

Component	Azure	AWS Equivalent	Action
Compute monitoring	VM metrics via Azure Monitor	EC2 metrics via CloudWatch	Configure AWS integration
Container platform	AKS	EKS	Deploy DynaKube to EKS, configure IRSA
Serverless	Azure Functions	Lambda	Install OneAgent Lambda layer
Log forwarding	Event Hub → ActiveGate	CloudWatch → Dynatrace Lambda	Deploy log forwarder

GCP → AWS / Azure

Component	GCP	AWS / Azure Equivalent	Action
Compute	GCE metrics	EC2 / VM metrics	Configure cloud integration
Container platform	GKE	EKS / AKS	Deploy DynaKube, configure identity
Serverless	Cloud Functions / Cloud Run	Lambda / Azure Functions	Configure monitoring
Log forwarding	Pub/Sub → ActiveGate	CloudWatch Lambda / Event Hub	Deploy new pipeline

Next Steps

Continue to **S2S-07: Dashboard, Workflow, and Integration Migration** to migrate dashboards and automations.

This notebook was AI-generated from community-submitted and publicly available sources. This notebook series is not officially supported by Dynatrace. Always verify information against official Dynatrace documentation.
