

# NR2DT-06: Step 6 — Migrate Synthetics, SLOs & Workloads

Series: NR2DT | Notebook: 6 of 10 | Created: April 2026 | Last Updated: 04/17/2026

## Overview

**Goal of this step:** complete Wave 2 (synthetics) and Wave 4 (SLOs + workloads). Synthetics are external-facing and visible quickly; SLOs need a 7-day delta-validation window before the math is trusted.

Procedural — see **NRLC-05** (Synthetic Migration) and **NRLC-06** (SLO & Workload Migration) for component depth.

## Table of Contents

- 1. [Wave 2 — Synthetics](#)
- 2. [Wave 4 — SLOs & Workloads](#)
- 3. [Step Exit Criteria](#)

## Prerequisites

| Requirement | Details                                          |
|-------------|--------------------------------------------------|
| Audience    | Migration lead + assigned engineer for this step |
| Completed   | NR2DT-05 — Migrate Dashboards & Alerts           |

| Requirement     | Details                                                     |
|-----------------|-------------------------------------------------------------|
| Format          | Procedural step — use as a runbook; defer to NRLC for depth |
| NRLC deep dives | NRLC-05, NRLC-06                                            |

## 1. Wave 2 — Synthetics

Order: HTTP first (lowest risk), then Browser, then API multi-step. Scripted browsers are out of band — they get rebuilt manually.

```
# Inventory + transform
python3 migrate.py migrate --diff --components synthetics

# Import (auto-converts HTTP, Browser, API; stubs scripted)
python3 migrate.py migrate --import-only --components synthetics
```

**Re-enter secrets** in the DT credentials vault for any monitor that uses bearer tokens, basic auth, or OAuth.

### Scripted browser monitors:

1. The transformer emits a stub Browser Monitor with the target URL
2. The original NR JS script is attached as a tag for reference
3. An engineer rebuilds the user journey using DT's clickpath recorder or DSL
4. Validation: confirm the new clickpath catches the same regressions during a 1-week dual-run

**G2 — Synthetics SLA:** dual-run for  $\geq 1$  week. DT availability % matches NR within  $\pm 0.5\%$ . If delta exceeds, investigate location coverage and credential validity first.

## 2. Wave 4 — SLOs & Workloads

SLOs depend on metric expressions being mathematically equivalent. Workloads become OpenPipeline enrichments + IAM bucket conditions (Gen3 pattern).

```
python3 migrate.py migrate --diff --components slos,workloads
python3 migrate.py migrate --import-only --components slos,workloads
```

**Run the SLO auditor** (the most important validation in this wave):

```
python3 migrate.py audit-slos
```

The audit window and tolerance are set inside the auditor configuration, not via CLI flags. Target your 7-day / 0.5%-tolerance policy in the project's audit config.

Output per SLO:

```
SLO: Checkout Availability
NR SLI: 99.94%
DT SLI: 99.92%
Delta: 0.02% PASS (within configured tolerance)
```

Any SLO with delta > 0.5% needs investigation:

1. Check unit conversion (ms vs. s vs. ns)
2. Check entity scope — does the bucket / OpenPipeline enrichment filter capture the same entities as NR's workload?
3. Check time alignment — NR's `SINCE 7 days ago` may bin differently than DT's `from:-7d`

**G4 — SLO delta:** all SLOs report value within tolerance for  $\geq 7$  days.

## 3. Step Exit Criteria

---

### G6 — Synthetics + SLOs Migrated

- [ ] All synthetics migrated; G2 dual-run availability  $\pm 0.5\%$
- [ ] Scripted browsers rebuilt and validated
- [ ] All synthetic credentials re-entered in DT vault
- [ ] All SLOs migrated; G4 7-day delta  $\leq 0.5\%$
- [ ] Workload identifiers visible as OpenPipeline-enriched attributes in DQL queries

**Next step: NR2DT-07 — Migrate Logs, Tags & Drop Rules.**
